

Outcomes

We use standard questionnaires to help us evaluate our outcomes of surgical treatments. This helps us better understand how patients are going after surgery and advise future patients on expected outcomes. We are always trying to improve in our techniques and care, and assessing outcomes is important when striving for quality. Other surgeons and medical providers may benefit from this information as a teaching or research resource, but patient confidentiality is maintained at all times.

Some conditions and patients are more amenable to improvement with surgery than others. Not everyone replies to the follow-up questionnaires and we respect that.

Patient Satisfaction with Medical Care

All shoulder surgeries 2013-2017

Elbow and Hand

Outcomes of More Common Shoulder Procedures

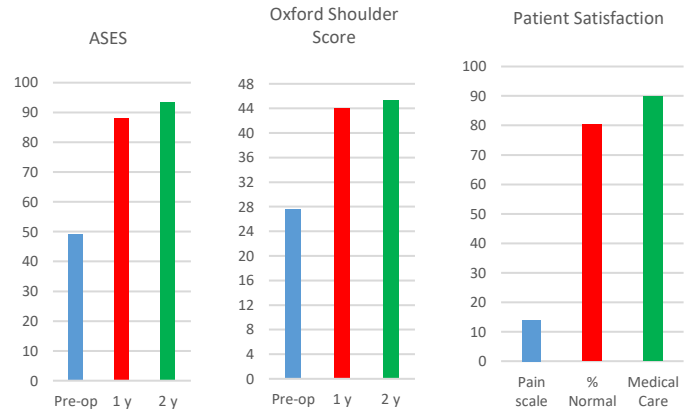

The ASES is the American Shoulder and Elbow Score. The maximum score (a 'perfect' shoulder) is 100.

The Oxford Scores are British scores. The maximum score (a 'perfect' shoulder) is 48.

The WOSI score is a Canadian score for the unstable shoulder. It is a very strict score, with a maximum of 100.

Here are outcome scores of those who have completed the scores pre-surgery, at 1 year post surgery and 2 years post surgery in the last five years

Supraspinatus Repair Surgeries

Multi-tendon Rotator Cuff Repair Surgeries

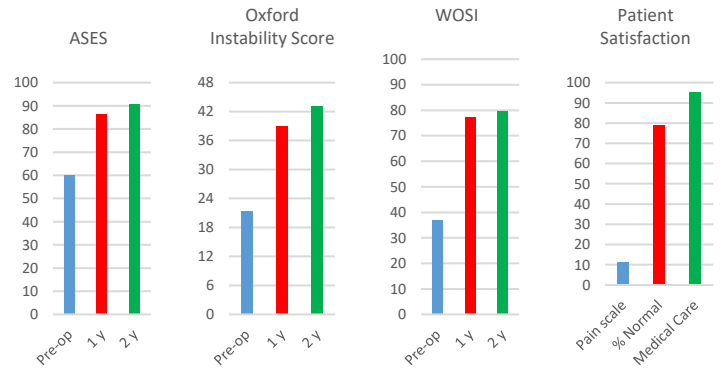

Arthroscopic Rotator Cuff Repair Surgeries

Open Rotator Cuff Repair Surgeries

Labral Repair Surgeries (excluding Anterior Stabilisation)

Rotator Cuff Repair Surgeries - Supraspinatus, partial thickness tears

Arthroscopic Anterior Stabilisation Surgeries

Calcific Tendinitis – Excision of Calcific Deposits

Open Stabilisation Surgeries (excluding Latarjet, HAGL)

AC Joint Stabilisation Surgeries

Open Stabilisation Surgeries - Latarjet

Total Shoulder Replacement Surgeries
